# Lake Eola Afternoon

September 20, 2026

Lake Eola Park

Partly Cloudy · 82°F

## Journal

Walked around Lake Eola this afternoon. The weather was really nice, so I stopped by the water for a while before heading home. A nice little break from everything.

# Business Rules

- The application supports only one user per device. Because all application data is stored directly within that device, a separate User entity is not required.
- An album may contain zero, one, or many vignettes, and a vignette may belong to zero, one, or many albums. This is relationship is handled by Album_Vignette, which links exactly one album to exactly one vignette.
- The application maintains a single set of settings containing the user's preferences, permissions, notification settings, home zone information, and theme.
- Candidate records are potential meaningful moments our application detects. Zero, one, or many Candidates may exist at a given time. Candidates are temporary and are discarded unless used to create a vignette.
- Visited_Location records store locations previously encountered by the application. Zero, one, or many visited locations may be stored and used to help determine whether a detected location is new to the user.

# Relationships

- Album and Album_Vignette: 1 to 0 or many
- Vignette and Album_Vignette: 1 to 0 or many
- Album and Vignette: 0 or many to 0 or many, implemented through Album_Vignette
- Settings, Candidate, and Visited_Location are independent entities and therefore have no explicit relationships in the ERD.
