Group Project Checkpoint #2 – Stakeholder Interviews

Class: CEN 4360

Semester: Fall 2026

Due Date: 2026-09-16

Stakeholder Interviews

Interview Questions

All three of us had different questions we asked our interviewees. You will find the three sets of questions below.

Set #1

- How often do you journal, if at all, in your daily life about things that happened recently?
- What kind of activities do you track?
- Have you ever thought about something that you might want to journal about, but enough days have passed that your memories aren't fresh about the details anymore?
- What happens if you wait to document those thoughts or feelings until a day or month later?
- [Insert app description] Does that sound like something you would use? If not, what more would it need for you to be interested, or what would push you away from using it regularly?
- Doing a good job with privacy is a major goal for this app. It will not save any of the data it uses. It will all stay on your phone until you either use or dismiss the idea, at which point all of it is deleted. Does that sound better, or could there still be some trust issues?
- Are there any other features you can think of?

- Are there any problems or changes you could think of with the app as described?

Set #2

- [Insert app description] What do you think about the overall idea of Memento?
- Do you currently use anything to journal or keep track of meaningful moments in your life? If so, what?
- Is the fact that the app would automatically identify moments that might be worth remembering make you more likely to journal or save these memories?
- What kind of things would make you want Memento to suggest a moment to you?
- How often would you like to have potential memories suggested to you?
- Considering the features we'd like to implement, which sensors and data would you be comfortable giving the app access to?
- Does knowing that the app will only ever store data locally and delete data that's no longer needed make you more comfortable?
- What concerns, other than with privacy, do you have about using Memento?
- What information would you like to have saved in a Vignette (post)?
- If there's anything you could add, remove, or change from the app as described, what would it be?

Set #3

The questions changed based on whether the person already journals or scrapbooks.

For those who already journal:

- What do you use to scrapbook/journal right now?
- What is the most cumbersome part of that process?

- Would changing whether you use your phone to do that (analog to phone, or phone to analog, whichever you do currently) strike you as a positive? Why or why not?
- Can you think of one feature technology might add to the process that would appeal to you?

For those who would be new to journaling:

- How do you memorialize important moments?
- What keeps you from using a journal or a scrapbook?
- Would it be easier for you to start doing so with analog materials, or with a phone? Why?
- What is one feature that would persuade you to start doing journaling/scrapbooking?

For both:

- What is one inevitability of commercial creep that you hate to see in apps?
- Rank these annoyances in an app: slow performance, unintuitive navigation, and ugly user interface.

Transcripts

Transcript #1

Interviewer: I'll start by explaining what the project is, because we changed the scope a little bit, and then I'll ask some questions. The project is a mobile app called Memento. We won't have registration anymore; we're phasing out the idea of having anything online, so everything is going to be stored on the device. You'll have to set up your profile and choose permissions.

It's basically a journaling app. We all have busy lives, and we don't always think about whether we should be taking a picture, taking notes about what's going on, or forcing ourselves to remember specific details about where we've been. At the end of the day, sometimes I can't even remember what I ate that day or where I went to eat. The idea is that the phone will keep track of notable things that

happened that day for you. At a preferred time of your choosing, it can send you a notification prompting you to go back to the app and take note of any notable events that happened that day.

Using your device sensors, it'll keep track of anything relevant based on your settings and offer you a list of potential events you may want to keep track of. It's up to you to choose which ones you actually want to store moments of, or not, and then we start again the next day. When you first launch the app, you'll be asked what type of information you're comfortable with or want your device to keep track of for you. It'll ask you for things like your home zone so it knows not to track anything within that area. It'll ask if you want to keep track of weather, elevation, exercise, and things like that.

As the day goes on, it'll keep track of the things you asked it to track and gather information on what might be an event that's out of your usual routine. Let's say you're going to a zoo today and you haven't been there in a long time, or you've never been there at all. The app might say, "We see that you were outside of your home zone for a while today and were in the vicinity of this place. Would you like to make a journal entry?" We call them vignettes. Then it's up to you to store a picture, a description of what happened, your mood, the weather, or anything you want to store about that moment. You can also make albums, like if you went on a trip for a whole week and want to store all those memories in one place. What do you think of the overall idea?

Interviewee: I like the idea. I've always been someone who's thought it would be nice to scrapbook or journal, but I am terrible at sitting down and doing things, so it's nice for it to be something easy that you can use to keep track of stuff you may want to remember. I think it's a cool idea. It's very cute and fun. Obviously, now that you're no longer able to make friends, you lose that motivation from social media and sharing with people.

Interviewer: We did want to implement that, but it's so much work for the scope of the class. If it's a project we end up working on afterward, we definitely will do that. For now, it's more of a personal thing. We might consider a way to export it, perhaps.

Interviewee: That would be nice. You know how Spotify and other apps have a year in review where you can share it? It makes a nice, postable picture that gives you a summary. That would be cool.

Interviewer: Maybe something like that. We'll think about a way to integrate it because I don't necessarily want it to be completely cut off from everybody else. At the same time, it's not feasible for us with the time we have, considering we all have lives and other classes, to implement a server and APIs.

Interviewee: Oh yeah, no, it's a lot of work.

Interviewer: For now, it's going to be mostly offline, though I will keep in mind a way to share with people through a third-party app. Maybe it could offer, "Do you want to share this post?" through Discord or something. You said you've always wanted to do something like this but have never really sat down and done it. I'm guessing you don't currently have anything that keeps track of memories or things like that?

Interviewee: Outside of social media and saving what you post, no. Basically, if it's on a phone and it's easy, I'll do it, but I won't sit down and write in a journal because it's a lot of work.

Interviewer: I feel the same way. I've considered it a few times but never actually sat down and done it. Would having your phone automatically identify moments that might be worth remembering make you more likely to do it?

Interviewee: Yeah. Something that would be cool to think about is that a lot of times I'm terrible at even taking a picture when I'm somewhere, but if you're documenting something digitally, you're going to want a picture. Maybe it would be a good idea to have a setting you can toggle on and off so that when it identifies you're in a place of interest, like an unusual location, it sends a notification saying, "You're in an unusual place. Take a picture," or something like that to save for later.

Interviewer: That's a good idea. The only thing is that we didn't want users to feel like we were harassing them, but maybe it could be a toggle that you switch on if you know you're going on a trip or something. Would that make it easier?

Interviewee: Yeah. If you can turn it on and off, that would help because otherwise it could annoy someone. It would also be cool if you could click the notification and it brings you directly into the app. It might be a good idea to integrate being able to take a picture directly in the app, if you're planning on doing that.

Interviewer: We are.

Interviewee: If you click on the notification and it takes you right to the spot where you're taking a picture to add to a new vignette, I think that would be cool.

Interviewer: What kinds of things would make a moment feel significant enough for you to want to get notifications about it? For example, we're planning on location because that's a big one. We were also looking to integrate weather based on GPS location, maybe elevation, exercise, and how long you've been outside of your home zone.

If you're going to a shop for five seconds, we're not really going to send you a notification about that, but if you're going to a zoo, you're going to be staying there for a longer period of time, so that makes it worth notifying you about. Is there anything specific you think wouldn't be useful, or anything we haven't mentioned that would be good to have?

Interviewee: I think you mentioned elevation. I don't know if that would be helpful, but then again, I live in Florida, so there really is no change. I think weather is a nice one. It would also be cool if you could add mood, if you're planning on doing that.

Interviewer: We were planning on having mood be an option after you get a notification, because we can't really track your mood. When you're doing the onboarding, it'll be an option you can toggle if that's something you want.

Interviewee: Yeah, something you have to add in. In terms of phone metrics, I'd say weather and location are probably the ones that make the most sense. Pulling weather from the location you're at versus from your phone is probably going to be easier, but I don't know.

Interviewer: I feel like the weather from your phone has to be from a third-party app anyway. If we have to find an app on your phone that has that, that might be

harder than pulling the information online based on GPS location. Do you have any concerns with the app asking to track these things, knowing that the information won't be stored online? Everything is going to be stored on your phone.

We also plan on having it so that, when you get the list of suggestions and choose only the things you want to talk about, the information for everything else is automatically deleted. For the things you do want to keep, you can pick and choose what you actually save, and anything you don't save won't be kept. Knowing that, is there any concern you might have about privacy or anything we need to look out for? For example, the app asking for your GPS location and you not being comfortable with that.

Interviewee: So many apps ask for your location. I feel like if you're the kind of person who wouldn't be okay with sharing your location with an app, this project just isn't the app for you because location is important to the functionality. It wouldn't bother me.

Interviewer: That was a big concern for us because we don't want users to feel like we're spying. We've thought a lot about not keeping a whole lot of information, just whatever is necessary, keeping it to the minimum, clearing it as much as possible when we're done with it, and only saving whatever the user chooses to save. I wanted to see if you had any concerns.

Interviewee: Instagram is doing something really scary where it has a map that can show where everyone is if they allow it to track their location in that sense. It can literally display your location to your followers, which is nuts. That's a lot scarier. Even without that, Instagram still tracks your location because it gives you the option to tag story posts or regular posts with a location. I feel like a lot of apps do that these days, and it doesn't bother me as long as it's not shown to people I don't know on the internet, which isn't a problem with your app.

Interviewer: If we do have a share option, you'll also have the option to say which parts of the post you actually want to share.

Interviewee: Yeah, and you're also not live-sharing a person's location.

Interviewer: No. It's more like if you have a post that has your location for that day on it and it's not something you feel comfortable sharing, when you go to share that post, we'd have the option to remove it.

Interviewee: Yeah, that makes sense.

Interviewer: Two more questions and then we're done. Do you have any concerns aside from privacy about using the app, like battery usage, storage, or anything else?

Interviewee: I don't think storage or battery usage would be a problem. I've played mobile phone games, and those eat up battery and storage way worse than I think what you guys are going to make.

Interviewer: If you could add, remove, or change anything about the app, is there anything you would change? Aside from the social stuff, which is out of scope for the course. We would do it if we could, or if we end up having time.

Interviewee: I don't think so. We already talked about the social aspect. I think if you guys could incorporate creating a post to share somewhere else, like Discord, Instagram, or Twitter, that would be cool. It would solve the problem of the social aspect in a scaled-down way.

Interviewer: I already have an idea for it. All right, thank you so much for your time. I appreciate it.

Interviewee: Yeah, no problem!

Transcript #2

Interviewer: How often do you journal, if at all, in your daily life about things that happened recently?

Interviewee: Maybe every other month or so. Sometimes a little more often, sometimes less. Usually I just need to get some thoughts organized and externalized, so I type them out. As an outlier, I did use the app Daylio to track activities, caffeine intake, and mood for about a year, which also included some journal notes.

Interviewer: What kind of activities did you track?

Interviewee: Pretty much everything that year. It's super customizable, so I added stuff anytime something new came up: what I did, whether or not I spent time with people, and how I felt. Sometimes I'd do it from memory the following day if I forgot to.

Interviewer: Have you ever thought about something that you might want to journal about, but enough days have passed that your memories aren't fresh about the details anymore?

Interviewee: Sort of, but not really. I think I'm maybe weird about memory, though. Usually if I journal, it's to sort out thoughts and feelings of the moment, not necessarily tell a story for posterity. For the things that I want to remember experiencing accurately, I document as directly as I can, like with images and video, timestamps, and concert setlist spreadsheets. With facts. Those facts get distorted over time, and a decade later I only remember what I repeatedly said or thought about the experience. So yes, details don't stay fresh, but the urge to journal is tied to the feelings close to the event.

Interviewer: What happens if you wait to document those thoughts or feelings until a day or month later?

Interviewee: A day is usually within range where it'll be pretty fresh. Like I mentioned, sometimes I'd catch an entry up the following day with what I could remember. However, those were regular, forgettable days. A month, though, is a huge amount of time for a regular day. A more memorable event will stay "fresher" longer, but it also might distort or distill down to my understanding of it as time passes because what I do is replay the event over and over.

A forgettable day where I did nothing out of the ordinary is forgotten in about a week. I couldn't tell you what I ate two weeks ago, but I could describe Matt Bellamy smiling during the Hexagons outro because I GIF'd it from my concert footage and watched it over and over.

Interviewer: We intend to create a journaling app called Memento where the app uses data on your phone, such as location, weather, etc., to generate suggestions for moments in your day that you may have missed when thinking of things to journal about. Does that sound like something you would use? If not, what more

would it need for you to be interested, or what would push you away from using it regularly?

Interviewee: I am, by default, very wary of any app using any of my data for anything. Any time my phone offers a feature vaguely similar to that, I immediately go to settings to banish whatever app has dared to speak out of turn in my domain.

That attitude aside, a huge point of journaling is actually to train oneself to remember things or notice things. If I'm tracking my mood, that's to notice how I feel in my daily life. It's a therapy tool to check in with oneself. Making it a habit influences how much attention you pay to it outside of journaling. So, to me, having an app try to algorithmically suggest journaling topics defeats the purpose of journaling.

Sorry, I realize this is harsh feedback. I am so picky about apps because my phone is a sacred space that I need full control over. It would become a reminder to journal, and if I got a notification, I would swipe it away in annoyance for interrupting whatever I'm doing until I just turn it off or uninstall.

That being said, a function I could get behind would be for it to suggest a time to journal when it thinks I'm not busy. If, based on location, it can tell that I'm done working and I've picked up my phone, maybe now I have a moment of free time to slow down and it can suggest that. Then have it learn or adjust according to whether you actually engage with the notification or immediately kill it, until it finds a pattern for when a good time is.

Interviewer: Don't apologize; those are good points, some of which were things I was planning to get to. I'll try to hit them one at a time. I sympathize with your point on notifications. We weren't planning on using notifications to tell you when to journal. If anything, reminder notifications were one of the options we considered making configurable in settings. When you decide to open the app on your own, it shows a list of ideas you can choose from, or you can just make your own entry.

Interviewee: Yeah, I'm on board now. I think I misinterpreted the idea a bit.

Interviewer: You also mentioned privacy. Doing a good job with privacy is a major goal for this app. It will not save any of the data it uses. It will all stay on your phone until you either use or dismiss the idea, at which point all of it is deleted. Does that sound better, or could there still be some trust issues?

Interviewee: Yeah, that sounds good. I would maybe have a customizable time frame for a chunk of that data. Does someone want to journal weekly and then have prompts about stuff throughout the week? Or it could be daily, but they work a weird schedule or hop time zones. Let the user define where their day starts, or just their journaling timeframe, whether it's "since last entry," "when X alarm went off," or when a smartwatch says you woke up, etc.

Interviewer: That would be a good idea. So, in the settings, you can adjust how far back in time the ideas go before being deleted?

Interviewee: Yeah, exactly.

Interviewer: Are there any other features you can think of?

Interviewee: There are days where I don't even go anywhere, so I'm thinking about what the app can see or suggest. It could look at other apps opened and go from there, but on a day where I don't touch my phone and I'm on the computer all day, whether I'm watching stuff, gaming, browsing, or drawing, is it just going to be empty?

Interviewer: That is a good question. We may have to think of more kinds of data that could be used.

Interviewee: A Fitbit or smartwatch would be a very useful source. From just heart rate, you can tell whether someone is asleep or awake, active or stationary. But not everyone has that, of course. Weather could be fun, like, "It rained today, did you notice?" or "Traffic in your area was extra bad. Aren't you glad you stayed home?"

Interviewer: There may still be ways to gather data to tell physical activity. I'm pretty sure most phones can count steps, but this is in the case of your phone being left sitting on the desk all day.

Interviewee: It could also suggest including browsing data. A lot of browsers will sync that across desktop and phone.

Interviewer: That actually might not be a bad idea. It could allow the user to give permissions to connect to other apps, like a web browser. I wonder if Discord access could also show what games someone played, etc.

Interviewee: Yeah, connection to Discord or Steam maybe. It's such a slippery slope. Any app asking for all these permissions would seem suspicious. But as long as it's local only, not sent anywhere, and deleted regularly, it seems fine.

Interviewer: I also planned to ask about any problems or changes you could think of, but I think we went over that. Do you have any more?

Interviewee: I would definitely have an option to show previous entries in fun ways. Once you're years into it, show all previous entries on that date, like how Snapchat brings back archived snaps from X years ago. So, like a "remind me of this nice time" in a month or a year button or pin, like a starred entry or something. And then an end-of-year summary or annual reminder. You could also do a randomizer, like, "Show me a random old entry."

Interviewer: Right. All of those, or some subset of them, would be good extra features that could be easy to implement.

Transcript #3

Interviewer: The app is called Memento. It uses information from your phone, such as GPS location, weather, elevation, and activity, to identify potentially notable moments in your day. For example, maybe you went on a run, experienced unusual weather, or visited somewhere like a zoo. The idea is to identify things that are out of the ordinary based on your activity.

At the end of the day, or at a time you choose, the app can send you a notification and present what we call "vignette candidates." A vignette is essentially a journal post. You can decide whether you want to save each candidate.

We would never store data outside of a local database on your phone. For the scope of the course, there also won't be social features within the app. We may

allow you to share a post through a third-party app such as Instagram, Discord, or Messenger, but there won't be a social network built into Memento itself.

When you first install the app, you'll go through onboarding and choose what you're willing to let the app track. You'll also define an area you're usually in so the app can ignore routine activity there. For example, you probably don't need it suggesting that you journal about going to the grocery store. Other things, such as mood tracking, can be turned on or off.

That's a high-level overview. What do you think about the overall idea of the app?

Interviewee: I think it would be a hard sell for most people because they may feel like it's spying on them all day and that their information could eventually be sold to a third-party advertising company. That's a major concern with a lot of apps these days, including apps that already collect information without your consent.

For people who specifically want this kind of functionality, it sounds nice. It just seems like privacy would be a concern for a lot of people.

Interviewer: We thought about that, which is why we're storing the information directly on the phone. I understand that doesn't completely solve the concern, because technically an app could still send information online, but Memento won't store anything long-term. It will delete information as soon as it's no longer needed, probably within 24 or 48 hours.

We also don't intend to store your entire location history. If we're tracking your location while you're out, for example, we wouldn't keep every point along the route you traveled. We would only keep the general vicinity of somewhere you stayed for a meaningful amount of time. If you remained somewhere for around 15 minutes, for example, it might record that location as somewhere you visited.

Interviewee: You may only keep that one point, but you're still going to have to gather the other location data in order to determine which point to keep.

Interviewer: Yes, for a short period of time, but we wouldn't store that information long-term. After whatever delay we decide on, we'd only retain the relevant location until you decide whether you want to keep it as a vignette. If you dismiss it, that information is deleted completely.

That's about as much as we can minimize the information without defeating the purpose of the app. I also understand that the app won't be for everyone, but I think that's about the lowest amount of information we can reasonably keep.

Interviewee: I think someone who is already comfortable with the app tracking that information will use it, but you're probably not going to convert someone who's hesitant about it. You can say you're not going to store the information, but what happens if the app gets bought by another company a year later? This kind of tracking data could be a gold mine for some companies. If someone has already done the work of collecting it and all another company has to do is sign a check, that would still concern someone who is already worried about privacy.

Putting that aside, if I wanted something that automatically determined the highlights of my day, I would have to try the app to see whether I felt it was smart enough to identify things that actually matter or potentially matter. I'd want to see how well it works as a kind of highlight reel.

Interviewer: For the scope of this class, since we have limited time and resources, we're planning to use a specific timeframe, a home zone that the user declares, and a scoring system. For example, if you go somewhere outside your home zone every day, that location wouldn't score as highly as somewhere you haven't visited in two weeks, and somewhere you've never visited would score even higher.

Interviewee: My question is: why are you determining what it's worth instead of the user? What if the user wants to track how often they go to McDonald's?

Interviewer: We could leave some of that to the user. The purpose is mainly to identify events someone might otherwise forget to track, such as going to the zoo or visiting an area of town they've never been to, something outside their normal routine.

Interviewee: When you say "forget to track," I feel like if someone is doing something exceptional, that's exactly when they wouldn't forget. If I'm doing something special, that's when I'm probably going to take pictures because I already know it's special.

Interviewer: That's good feedback. I'll keep that in mind. Do you currently do anything to keep track of memories or meaningful moments?

Interviewee: My phone does it automatically for me.

Interviewer: What do you mean?

Interviewee: Apple does that with pictures. When you take pictures, Apple will later put them together in a Memories category.

Interviewer: So you essentially let your phone do it for you with the pictures you take.

Interviewee: That's the one thing I do, although I don't do it consciously. It's a feature Apple already provides.

Interviewer: It doesn't include things such as your thoughts, mood, or weather, though.

Interviewee: No. It doesn't add much other metadata beyond the location and pictures. It takes those into account, and perhaps proximity to other users as well.

Interviewer: Would having your phone automatically identify moments that might be worth remembering make you more likely to journal?

Interviewee: Would I journal? No. However, would I be more likely to journal if some of that work were already done for me? Yes. I'm still probably not going to do it, but I would be more likely to.

It's a good idea. If I had any desire to journal in the first place, this would increase the likelihood that I actually did it.

Interviewer: What kinds of things would make a moment significant enough that you would want it suggested to you? What would make you want pictures, a journal entry, weather information, or something similar associated with that moment?

Interviewee: Do you mean in terms of something the application can track, or just in general?

Interviewer: Just in general. What type of moment would be significant enough that you'd want the app to track it for you? Even if it's something we can't currently implement, it could give us ideas for other approaches.

Interviewee: That's difficult to answer on the fly. If it's something planned, a trip, a visit to a theme park, or a planned lunch, then I already know it's going to be important. Determining whether something is important spontaneously is very case-by-case, so I don't think I have a blanket answer.

Interviewer: Suppose there were a way for the app to know you had an event coming up, perhaps by connecting to your calendar. It could recommend that event specifically or remind you to take pictures. Would that make it easier to keep track of important moments? Sometimes people forget to take pictures because they're caught up in the moment.

Interviewee: I picture arriving at a theme park, having fun, and then getting a notification asking, "Have you taken a picture yet?" I think I would get annoyed and turn it off.

Interviewer: Notifications would be configurable in the settings. If you don't want notifications as soon as the app identifies something relevant, you could turn them off. Other people might want that feature, so we'd make it optional.

Interviewee: In that case, the best answer I can give is that something scheduled beforehand would be a useful indicator. Otherwise, it's difficult to know whether something matters. If you're only using the fact that I'm outside my normal location area, I might simply be visiting a restaurant I haven't been to before. That doesn't necessarily mean I want to remember it; maybe I just went to an Arby's.

Interviewer: The idea is that it would offer you the option to remember it if you wanted to.

Interviewee: I don't think location alone is necessarily enough.

Interviewer: Ideally, location wouldn't be the only factor.

Interviewee: That's why I mentioned scheduled events. Something scheduled is purposeful. You're making a note of it beforehand because it's special in some way.

Interviewer: That's probably one of the better indicators.

Interviewee: Apps can read calendars with permission.

Interviewer: I know; I'm just not sure whether we have the tools or time to implement it for this project.

We already talked about permissions, so does knowing that the information stays on your phone make you more comfortable granting those permissions, or does the possibility of the app eventually being sold to a company that might misuse the data mean it doesn't change much for you?

Interviewee: It definitely makes it more comfortable. Between two uncomfortable situations, the more comfortable one is the one where the information doesn't leave the phone. So yes, that helps.

Interviewer: Aside from privacy, what concerns would you have about using the app? For example, battery usage, storage space, or anything else?

Interviewee: Privacy is the biggest concern. Other than that, battery could be an issue because checking GPS location in the background can be expensive in terms of power. You would need to limit how often it checks; if it's implemented poorly, it could drain the battery.

Storage is less concerning. You're not taking pictures automatically with the app, right?

Interviewer: No. The user would only have the option to take a picture through the app or select one from their gallery.

Interviewee: Then storage wouldn't concern me very much. At that point, most of what you're collecting is data rather than media. Images and videos are the main things I would consider significant storage concerns on a device.

Interviewer: Is there anything else you can think of, or are battery and privacy the main concerns?

Interviewee: Those are the main two. Notifications potentially being annoying is another concern, but that's something you can make customizable.

Interviewer: We're trying to make the tracking customizable as well. If you don't want the app to track your location, it won't. The same goes for weather, elevation, exercise, and the other data sources. We want to keep tracking minimal and not collect anything the user hasn't chosen to provide.

Interviewee: That should absolutely be toggleable. When the user opens the app for the first time, I think they should immediately be shown a list of permissions so they know exactly what they're opting into. I would probably default all of them to off, although that's ultimately a design decision.

Interviewer: That's essentially the plan. During onboarding, users will see the different options and choose which ones they want enabled.

Imagine the app suggests a moment from your day. For example, it notices that you went to Universal and asks whether you want to make a post about it. What information would you want to see or add before saving that memory? It could be Universal, a wedding, or any other event.

Interviewee: I'm not sure. That's going to depend a lot on the design of the app.

Interviewer: Thinking about an event you want to remember, what would matter most to you? Would you want a picture, something written about it, or information such as the location, date, time, and weather?

Interviewee: I think you should provide all of those options and make them optional, because it's going to vary from person to person and from event to event.

Interviewer: For you personally, which would be the most important?

Interviewee: Probably pictures.

Interviewer: Would location also matter, or would the picture be the main thing?

Interviewee: Location would matter too. You asked for the most important thing, so I picked one. Pictures would be the most important, but location factors into it as well.

Interviewer: Last question: if you could add, remove, or change anything about the app based on what we've discussed, what would it be?

Interviewee: Considering that it's still more of a concept than a concrete app, that's difficult to answer. I think I would need to actually use it before I could give that kind of feedback.

Interviewer: That's fair. I appreciate your time. Thank you very much.

Interviewee: You're welcome.

Transcript #4

Interviewer: Do you already journal or scrapbook?

Interviewee: No.

Interviewer: How do you memorialize important moments?

Interviewee: I usually associate certain moments or details with the memory to trigger the rest of it. For example, I'll make a mental note: "If I think of this specific thing, remember the rest of it."

Interviewer: What keeps you from using a journal or scrapbook?

Interviewee: I find it a bit tedious, though I would be open to it for especially important things that I absolutely must remember.

Interviewer: Would it be easier for you to start doing so with analog materials or with a phone?

Interviewee: Probably a phone.

Interviewer: Why?

Interviewee: I already own a phone, and I always have it with me.

Interviewer: What's one feature that would persuade you to start doing so?

Interviewee: Easy accessibility and ease of entry. I wouldn't want to be bombarded with a ton of options just to get into it. Having more options introduced gradually as I learn the app would be good, but simplicity is something I'd look for in the beginning.

Interviewer: What's one example of commercial creep that you hate to see in apps?

Interviewee: The worst version is when something is intentionally placed where I would normally press from muscle memory, especially if it loads late. I might think

I'm pressing a certain spot on the screen, only for an ad to appear and send me to another app or browser without me wanting it to.

Interviewer: Rank these app annoyances: slow performance, unintuitive navigation, or an ugly UI.

Interviewee: It depends on how slow the performance is. If it's really slow, that would be number one. If it's only somewhat slow, I can deal with it. Assuming it's only somewhat slow: 1) unintuitive navigation, 2) slow performance, and 3) ugly UI.

Transcript #5

Interviewer: Do you already journal or scrapbook?

Interviewee: No.

Interviewer: How do you memorialize important moments?

Interviewee: Mostly through pictures that I keep digitally. My family also has a scrapbook that stays with my mom.

Interviewer: What keeps you from using a journal or scrapbook?

Interviewee: It feels redundant with what my family already does, so I don't feel a need for a personal journal.

Interviewer: Would it be easier for you to start doing so with analog materials or with a phone?

Interviewee: Definitely a phone app.

Interviewer: Why?

Interviewee: Physical space is expensive, and I already have a phone.

Interviewer: What's one feature that would persuade you to start doing so?

Interviewee: I'd be more interested if I took up a hobby with more unique experiences. I'm mostly a gamer, where recordkeeping is already done automatically, so I don't currently feel like there's much I need to keep track of.

Interviewer: What's one example of commercial creep that you hate to see in apps?

Interviewee: Ads, definitely ads. Especially ads that interrupt the app and require interaction or watching.

Interviewer: Rank these app annoyances: slow performance, unintuitive navigation, or an ugly UI.

Interviewee: 1) unintuitive navigation, 2) slow performance, and 3) ugly UI.

Interview Analysis

Before diving into the analysis of the interviews, it is worth noting that after making our planning document, we decided to drop the social features from the scope of our application. This means that, although we initially talked about having friends and sharing Postcards and Albums with them, this is no longer part of our plan.

Something else worth noting is that we knew going into it that privacy would be a big concern for our stakeholders. It is scary to give an app permission to use your personal data and phone sensors. Many are those who simply refuse to install such apps, and we expected this to be reflected during our interviews.

After going through the conversations had between our team members and our stakeholders, the following topics stood out to us.

The Idea of Memento

While some did say that the application as planned would not be useful therapeutically due to it deciding what is important to journal for you, the

majority seemed to agree that Memento would help make journaling easier and more easily accessible.

Privacy Concerns

After talking to the stakeholders about the measures we intend to put in place in order to ensure that our users are as comfortable as possible in using our Memento and that they can rest assured their data is safe, some concerns remained. This is therefore something we will need to keep in the forefront of our minds as we develop our application.

Personalization

It seems to be a consensus that Memento needs to be as customizable as possible so that it may best cater to each user's needs. We had already planned on making the notification settings customizable, and the same can be said of the information that the app will keep track of, but it was suggested that even the score a memory is given be customizable. For example, one user may want to track locations they go to often more than those they never go to, so they would give more weight to those.

Photos

Making sure that there is camera integration and/or the possibility of importing pictures from the phone's gallery was something that came back as one of the most important things to be included in a Vignette. Because people may forget to take pictures while they are out and about, having reminders is something that some have said would be useful, though others have mentioned they would be annoyed by it. This comes back to personalization: allowing each user to decide which notification they want and when is a massively important feature for our app.

Battery Usage

Although this is not a massive concern that stakeholders had, some did mention that if the app was constantly tracking GPS location, it could

potentially drain the battery fast. Therefore, we may need to limit the frequency of the GPS tracking to ensure that this is not an issue.

Onboarding

Someone mentioned that we should be careful not to bombard users with too many options at the time of opening the app, and this is something we will need to keep in mind when we design our onboarding process for first time Memento users.

Feature Suggestions

As social features are now outside of the scope for the app, it was suggested that we find a different way to allow users to share their content, perhaps through third-party apps. We have therefore considered making an image from a user's Vignette and then having a "Share" option which they could use to send that image to their friends and family using their app of choice.

Something else that was recommended was to implement a way to make old memories resurface automatically so that the user does not simply make a post and forget about it. We could do this based on the date but also based on the user's location.

Finally, we were also recommended to have a calendar implementation so that we may use someone's planned events to trigger Vignette Candidates.

All three suggestions will be considered for implementation.

Takeaway

While most of the feedback does not impact our UI design directly, they do give us a lot to think about regarding the functionality and implementation of various features. We will need to ensure that we keep all of it in mind during the development stage so that our app may better serve its intended purpose.

Low Fidelity Prototype
